

Information Security Services

“Not just an umbrella, but a strong foundation.”

What is information security?

Information security is a combination of technology and individuals working together to protect a business from unacceptable risks to their information assets. The three primary elements of information security are **confidentiality, integrity, and availability**.

Information security is not limited to computer systems, but applies to every aspect of protecting valuable information assets.

Why does your business need information security?

Businesses today are learning that an information security breach can result in a negative impact on current and potential business. Some of a business's most critical assets are its image, integrity, reputation and customer confidence. Once a security breach has occurred, the results can be devastating. Your existing and potential customers lose confidence in your ability to protect private and critical information, which equates to lost sales, lost customers, and long term damage to your business's reputation.

How does SCS, Inc. help your business stay secure?

SCS, Inc. has the staff, experience, and information security background for a proactive and comprehensive approach to safeguarding your information assets. Our business is to enhance your information security strategy and protect your information assets, enabling you to focus on accomplishing your business priorities. SCS, Inc. uses a layered and unobtrusive security approach:

- Security Training – your best protection against a security breach are your employees. Training end users on security awareness improves your security structure and is the first step in the layered approach to security.
- Security Policy – Information security starts with awareness. Security policies document the direction and expectations of your business's security strategy.
- Security Assessment – Where do your vulnerabilities lie? A security assessment provides a blueprint of security recommendations and an understanding of your business's risk tolerance.
- Security Configuration – Making the changes needed to mitigate the risks. This is the center of gravity for information security.
